#### Abstract

A library of hybrid oxazole-triazole based compounds containing contiguously linked aromatic units were synthesised as G-quadruplex binding ligands. The design of these ligands was based upon combining features of our first generation of G-quadruplex bis-triazole ligands and the natural product telomestatin. The syntheses and biophysical studies of these ligands are described.

## 1. Introduction

G-Quadruplex structures are organised polymorphic tertiary assemblies formed by oligonucleotides and nucleic acids containing G-tracts. ${ }^{1,9}$ A core of hydrophobic G-quartets and a periphery of negatively charged loops characterise these structures, which exhibit higher stability over other possible conformations in the presence of monovalent cations, such as $\mathrm{Na}^{+}$or $\mathrm{K}^{+}$. Putative Gquadruplex sequences have been identified in the genome, ${ }^{2}$ with over-representation in guanine rich sequences, such as telomeres, ${ }^{3}$ in the promoter regions of a number of proto-oncogenes, ${ }^{4}$ such as $c-m y c^{5 \mathrm{a}}$ and $c-k i t,{ }^{5 \mathrm{~b}}$ in $5^{\prime}$ untranslated regions ${ }^{6 \mathrm{a}}$ and in introns. ${ }^{6 \mathrm{~b}}$ Unsurprisingly, several of these structures have become attractive targets for cancer chemotherapy.

For example, inducing the single-stranded telomeric DNA overhang to fold into G-quadruplexes has been shown to inhibit telomerase activity ${ }^{7 \mathrm{a}}$ and cancer cell growth. ${ }^{7 \mathrm{~b}}$ This is significant, since in $>80 \%$ of cancers telomerase is up-regulated and contributes to the malignant phenotype by maintaining cancer cell immortalization. ${ }^{7 \mathrm{C}}$ In addition to perturbing telomere elongation, the induced G-quadruplex structures result in telomere uncapping, which leads to rapid growth arrest or apoptosis. ${ }^{8}$ This creates a window of opportunity for the design and synthesis of G-quadruplex binding ligands with a view to employ them as therapeutic agents. ${ }^{9,10}$

[^0]In recent years numerous G-quadruplex binding ligands have been identified, the vast majority possessing a large aromatic/heteroaromatic unit, usually locked into a planar disposition. ${ }^{9,10}$ These aromatic moieties $\pi$-stack onto the terminal tetraplex of the quadruplex providing extra stabilisation, and can even induce folding into the higher order structures. ${ }^{9,11}$ Side chains, which have a positive charge or that can become protonated at physiological pH , are another common feature, and provide points for electrostatic interactions with the negatively charged phosphate residues in the grooves. ${ }^{10}$ However, ligands that selectively target specific Gquadruplex structures are limited, presenting a significant challenge for further development. ${ }^{10 \mathrm{~b}}$

We have previously reported the synthesis and biological evaluation of a family of triazole based quadruplex binding 'click' ligands (e.g., 1, Scheme 1), which showed strong G-quadruplex stabilising effects, telomerase inhibition and anti-cancer activity. ${ }^{12}$ The design of these compounds was inspired by the non-fused complex polycyclic aromatic structure of telomestatin (2), a very potent telomerase inhibitor isolated from Streptomyces annulatus. ${ }^{13}$

We proposed that the 1,4 -triazole moiety would serve as a suitable mimic of the oxazole functionality of telomestatin (2), and could be readily installed using the powerful CuAAC click reaction, thus facilitating the synthesis of libraries of potential ligands. Indeed, the 'click' ligands (e.g., 1) displayed impressive selectivity for G-quadruplex structures over duplex DNA, comparative to that of telomestatin (2). ${ }^{12}$ Although 2 is an incredibly potent and selective quadruplex binder, it is also a complex synthetic target requiring lengthy syntheses, ${ }^{14}$ whereas our ligands were readily accessible in significant quantities.

telomestatin (2)

Scheme 1. Rational design and retrosynthesis of new hybrid G-quadruplex 'click' ligands.

We have since developed a second generation of tristriazole ligands (3), which were designed in order to examine whether Gquadruplexes could be stabilised by end-on hydrogen atom $-\pi$ interactions. ${ }^{15}$ However, whilst the loss of effective $\pi-\pi$ binding interactions by the inclusion of such tetrahedral centres was not balanced by potential hydrogen $-\pi$ bonding interactions, the quadruplex/duplex selectivity of the ligands once again remained high, suggesting that the rotational freedom of non-fused polyaromatic systems is important with regard to selectivity.

Taking these two factors into consideration, we have designed a third generation of ligands, again based on a non-fused polyaromatic system but excluding excessive conformational flexibility. Since $\pi$-stacking interactions had proven to be particularly important, we opted to increase the number of heteroaromatic units in the ligand cf. 1, in an attempt to maximise binding between electronrich ligand heterocycles and guanine residues. The general design of these hybrid ligands was to incorporate the oxazole motifs of telomestatin (2), and the 1,4-triazole and side chain functionalities present in our first generation (e.g., 1) (Scheme 1). Keeping in mind the proposed use of click chemistry, we opted to target a series of triazole-centred ligands (e.g., 4) flanked by phenyloxazoles (Scheme 1). Synthetically, the ligands would be accessed through a CuAAC reaction ${ }^{16}$ of the corresponding alkynes 5 and azides $\mathbf{6}$.

## 2. Results and discussion

The synthesis of our library began using the procedure of Scanlan et al., with a Sonogashira reaction of 4-bromobenzamide 7 with ethynyltrimethylsilane to give $\mathbf{8}$ in $88 \%$ yield (cf. $53 \%$, Scanlan, Scheme 2). ${ }^{17}$ Typical Blümlein-Lewy oxazole synthesis conditions (8, ethyl bromopyruvate, EtOH, reflux) provided oxazole 9 in low yield ( $<30 \%$ ). Hence, we opted for the two step procedure described by Panek, ${ }^{18}$ which provided the oxazole $\mathbf{9}$ in good overall yield. The TMS-protected alkyne was then unmasked and the ester hydrolysed in one step to afford the acid $\mathbf{1 0}$, which was converted to the acid chloride $\mathbf{1 1}$ by treatment with $(\mathrm{COCl})_{2} / \mathrm{DMF}$. Compound $\mathbf{1 1}$ was subsequently reacted with various $N, N$-dialkyldiamines to afford the alkyne coupling partners $\mathbf{1 2 - 1 7}$ for the ensuing click reaction.

The complementary azide-coupling partners were accessed via an analogous route. Hence, 4-aminobenzamide $\mathbf{1 8}$ was converted to the corresponding azide, which was then subjected to the same oxazole forming conditions as before to give 19 (Scheme 2). Hydrolysis of $\mathbf{1 9}$ was followed by conversion to the acid chloride 20, to
which a series of $N, N$-dialkyldiamines were added providing the amides 21-26. Finally, the azide $\mathbf{5}$ and alkyne $\mathbf{6}$ coupling partners were reacted together, under our previously developed microwave conditions, ${ }^{19}$ to deliver the new library of hybrid tri-azole-bisoxazole ligands 27-35 in good yield (69-87\%, Scheme 2).

The ability of these compounds to stabilise G-quadruplex and double helix DNA was investigated using a high-throughput FRET (fluorescence resonance energy transfer) assay. ${ }^{20}$ Table 1 shows the effect of different concentrations of compounds 27-35 on the melting temperature ( $T_{\mathrm{m}}$ ) of two labelled oligomers in 60 mM potassium cacodylate buffer at pH 7.4 . The G-quadruplex forming human telomeric ( $h$-Tel) sequence ( $5^{\prime}$-FAM-d(GGG[TTAGGG]3)-TAMRA-3') and the F10T (ds) sequence ( $5^{\prime}$-FAM-dTATAGCTATA-HEG-TATAGCTATA-TAMRA- ${ }^{\prime}$ )-a hairpin double helix labelled oligomer with an internal hexaethyleneglycol (HEG) linker.

At a concentration of $4 \mu \mathrm{M}$ several ligands, 31, 34 and 35, showed moderate to good stabilisation of the G-quadruplex structure with excellent selectivity over duplex DNA. Ligand $\mathbf{3 0}$ was by far the best binder $\left(\Delta T_{\mathrm{m}}=15^{\circ} \mathrm{C}\right)$ but it did not discriminate between duplex and quadruplex DNA quite as effectively as 31, $\mathbf{3 4}$ and 35, which is essential for development as potential therapeutics. The ligands with side chains containing three methylene units ( $n /$ $n^{\prime}=2$ ) were uniformly stronger quadruplex binders than the analogous ligands with side chains containing two methylene units ( $n /$ $n^{\prime}=1$ ) i.e., $\mathbf{2 7} \mathrm{cf}$. 30, $\mathbf{2 8} \mathrm{cf}$. 31, $\mathbf{2 9} \mathrm{cf}$. 32, $\mathbf{3 3} \mathrm{cf}$. $\mathbf{3 4}$. This may be due to the fact that the longer arms allow more effective positioning of the protonated amines for interaction with the phosphate backbone, or simply due to providing more interactions with the guanine quartet. It appears that the smaller ammonium ions interact more effectively than larger analogues, regardless of the length of the side chain, i.e., $\mathbf{2 7}$ cf. $\mathbf{2 9}$ and $\mathbf{3 0}$ cf. 32, suggesting that there is a pocket with some steric constraints where the protonated amines and phosphate backbone interact. At a concentration of $1 \mu \mathrm{M}$ the ligands were quite poor at binding G-quadruplex forming DNA, the unsymmetrical ligand 35 being the only ligand to show any real affinity for $h$-Tel. Although these ligands show comparable quadruplex binding ability to some previously reported ligands, ${ }^{21}$ they were rather disappointing bearing in mind our first generation of ligands, i.e., 1 (Scheme 1 ), which exhibited $\Delta T_{\mathrm{m}}=18{ }^{\circ} \mathrm{C}$ at a concentration of $1 \mu \mathrm{M}$ for the $h$-Tel G-quadruplex forming sequence.

However, one critical feature was prominent from these studies; the selectivity of the ligands for quadruplex DNA over duplex DNA remained consistently high, even at higher concentrations of the

${ }^{\text {a }}$ The FRET method was used to obtain values, which are a mean of three runs.
ligands. Although non-specific binding of the ligands to quadruplex DNA cannot be ruled out, it is noteworthy that this series of nonfused polyaromatic ligands have displayed excellent selectivity for quadruplex DNA over duplex DNA. In this context perhaps ligand 35 is most interesting, which displayed complete selectivity for quadruplex DNA over duplex DNA, even at a concentration of $4 \mu \mathrm{M}$, and showed a small amount of stabilisation of $h$-Tel at a concentration of $1 \mu \mathrm{M}$.

## 3. Conclusion

In summary, we have prepared a small library of hybrid Gquadruplex binding ligands inspired by the natural product telomestatin and our first generation 'click' ligands. These non-fused
polycyclic ligands comprised both triazole and oxazole functionality with pendant side chains and demonstrated modest, yet selective, affinity for the intramolecular $h$-Tel G-quadruplex.

We undertook SAR studies, which further confirmed the advantageous nature of designing ligands with non-fused polyaromatic motifs with regard to selectivity of the ligand for quadruplex DNA over duplex DNA. We believe that these results provide important information that will aid in the design of new Gquadruplex binding ligands that could potentially lead to novel cancer therapeutics.

## 4. Experimental section

### 4.1. General

High Resolution Mass Spectra were recorded on VG micron Autospec or Bruker microTOF. Fourier Transform Infrared Spectroscopy (FT-IR) spectra were obtained on Perkin-Elmer 1600 series or Bruker Tensor 27. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker AV(III) 400, Bruker AV 400, Bruker DPX 400 ( $400 \mathrm{MHz}\left({ }^{1} \mathrm{H}\right.$ ) and $100 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$ ) spectrometers. Coupling constant are given in hertz $(\mathrm{Hz})$ and the following notations indicate the multiplicity of the signals: s (singlet), d (doublet), br s (broad signal), t (triplet), q (quartet), quint (quintet), m (multiplet). Thin layer chromatography was performed on Merck precoated silica gel aluminium plates (60 $\mathrm{F}_{254}$ ) and visualised using UV absorption and/or an appropriate stain. Column chromatography was performed using Merck silica gel 60 (230-400 mesh). Petrol ethers refer to petroleum ethers $40-60^{\circ} \mathrm{C}$. Anhydrous THF was distilled from sodium wire/benzophenone and anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ from $\mathrm{CaH}_{2}$ immediately prior to use. MeCN and $\mathrm{CHCl}_{3}$ were distilled from $\mathrm{CaH}_{2}$ and stored over
activated $4 \AA$ MS. Toluene was dried by passing the solvent over an activated alumina column, which was pressurised with dry $\mathrm{N}_{2}$. Anhydrous DMF was purchased and used as received. Microwave reactions were conducted on a CEM Discover Explorer microwave reactor in sealed tubes with stirring at a constant temperature for the indicated time. Preparative HPLC was performed with an Agilent Technologies 1200 series system using a reverse phase column (YMC Co., Ltd., YMC-Pack R\&D ODS-A, $100 \times 20 \mathrm{~mm}$ I.D., particle size S-5 $\mu \mathrm{m}, 12 \mathrm{~nm}$ ). Analytical HPLC was carried out on using the same instrument as for preparative HPLC, using a reverse phase column (YMC Co., Ltd., YMC-Pack R\&D ODS-A, $100 \times 4.6 \mathrm{~mm}$ I.D., particle size S-5 $\mu \mathrm{m}, 12 \mathrm{~nm}$ ). Solvents were HPLC grade purchased from Fischer Scientific.
4.1.1. 4-(Trimethylsilylethynyl)benzamide ( $\boldsymbol{8})^{17}$. To a solution of 4bromobenzamide $7(8.00 \mathrm{~g}, 40.2 \mathrm{mmol})$ and ethynyltrimethylsilane ( 16.8 mL , 121 mmol ) in degassed ( Ar bubbled for ${ }^{3} / 4$ h) $\mathrm{Et}_{2} \mathrm{NH}(240 \mathrm{~mL})$ under an Ar atmosphere were added $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(1.42 \mathrm{~g}, 2.02 \mathrm{mmol}, 5 \mathrm{~mol} \%)$ and $\mathrm{CuI}(152 \mathrm{mg}$, $0.804 \mathrm{mmol}, 2 \mathrm{~mol} \%$ ). After 2 days the solvent was evaporated and the residue was suspended in EtOAc, which was then filtered through Celite. The filtrate was then washed with $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$ and brine ( 80 mL ) before being dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated. The product was purified by flash chromatography ( $1: 1$, EtOAc/petrol ethers) to give the title compound $\mathbf{8}$ as an off-white solid ( $6.63 \mathrm{~g}, 30.6 \mathrm{mmol}, 76 \%$ ). $R_{f} 0.16$ (1:1, petrol ethers/EtOAc); $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.78$ (2H, d, J 8.6), 7.56 (2H, d, J 8.6), 6.10 ( $1 \mathrm{H}, \mathrm{br}$ s), 5.75 ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}$ ), $0.28(9 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 168.9,132.8$, 132.1, 127.2, 126.9, 103.9, 97.4, -0.2 ; HRMS $\mathrm{ESI}^{+}$calculated for $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{NOSi}[\mathrm{MH}]^{+}$218.1001, found 218.0992.
4.1.2. Ethyl 2-(4-(trimethylsilylethynyl)phenyl)oxazole-4-carboxylate (9). The amide 8 ( $6.63 \mathrm{~g}, 30.6 \mathrm{mmol}$ ) was dissolved in dry THF $(125 \mathrm{~mL})$ under $\mathrm{N}_{2} . \mathrm{NaHCO}_{3}(8.98 \mathrm{~g}, 107 \mathrm{mmol})$ and ethyl bromopyruvate ( $3.90 \mathrm{~mL}, 31.0 \mathrm{mmol}$ ) were added, after which the reaction was heated to reflux overnight. After 16 h ethyl bromopyruvate $(3.90 \mathrm{~mL}, 31.0 \mathrm{mmol})$ was added and the reaction refluxed a further 7 h . The reaction was cooled to room temperature and filtered through Celite washing with EtOAc. The filtrate was concentrated then redissolved in dry THF ( 125 mL ) under $\mathrm{N}_{2}$ and cooled to $0^{\circ} \mathrm{C}$. Trifluoroacetic anhydride ( $12.9 \mathrm{~mL}, 91.8 \mathrm{mmol}$ ) was added dropwise and the reaction was allowed to come to room temperature slowly. The mixture was stirred overnight before being cooled to $0^{\circ} \mathrm{C}$, then a saturated solution of $\mathrm{NaHCO}_{3}(100 \mathrm{~mL})$ was added carefully. The reaction was neutralised by the careful addition of solid $\mathrm{NaHCO}_{3}$. The product was extracted with EtOAc $(3 \times 150 \mathrm{~mL})$ and the combined organics were washed with brine ( 100 mL ), dried ( $\mathrm{MgSO}_{4}$ ), filtered and concentrated. The product recrystallised from $\mathrm{Et}_{2} \mathrm{O} /$ petrol to give $\mathbf{9}$ as colourless plates ( $5.3 \mathrm{~g}, 16.9 \mathrm{mmol}$ ) and the mother liquors were purified by flash chromatography ( $9: 1$, petrol ethers/EtOAc) to give the title compound 9 as a colourless solid ( $2.2 \mathrm{~g}, 7.03 \mathrm{mmol}$, total $23.9 \mathrm{mmol}, 78 \%$ over two steps). $R_{f} 0.37$ ( $4: 1$, petrol ethers/EtOAc); $\nu_{\text {max }} / \mathrm{cm}^{-1} 2986,2157,1736 ; \delta_{\mathrm{H}}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 8.29(1 \mathrm{H}, \mathrm{s}), 8.09(2 \mathrm{H}, \mathrm{d}, J 8.4), 7.58(2 \mathrm{H}, \mathrm{d}, J 8.4), 4.46(2 \mathrm{H}, \mathrm{q}, J$ 7.1), 1.43 (3H, t, J 7.1), $0.29(9 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 161.9,161.3$, $143.8,134.9,132.4,126.7,126.03,126.00,104.1,97.4,61.4,14.4,-0.1$; HRMS ESI ${ }^{+}$calculated for $\mathrm{C}_{17} \mathrm{H}_{20} \mathrm{NO}_{3} \mathrm{Si}[\mathrm{MH}]^{+} 314.1212$, found 314.1206 .
4.1.3. 2-(4-Ethynylphenyl)oxazole-4-carbonyl chloride (11). The oxazole 9 ( $6.94 \mathrm{~g}, 22.2 \mathrm{mmol}$ ) was dissolved in $\mathrm{THF} / \mathrm{H}_{2} \mathrm{O}$ (2.7:1, $110 \mathrm{~mL})$. $\mathrm{LiOH}(1.08 \mathrm{~g}, 44.9 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$ was added slowly, stirred 1 h then heated to $50^{\circ} \mathrm{C}$ for 2 h . The reaction was cooled to room temperature and $10 \% \mathrm{HCl}$ was added until the $\mathrm{pH} \sim 2$. The product was extracted with EtOAc ( $4 \times 110 \mathrm{~mL}$ ), washed with brine $(80 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. The crude material was suspended in
anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ THF ( $4: 1,125 \mathrm{~mL}$ ) under Ar atmosphere with anhydrous DMF $(0.2 \mathrm{~mL})$ and cooled to $0^{\circ} \mathrm{C}$. $(\mathrm{COCl})_{2}(3.70 \mathrm{~mL}$, 44.0 mmol ) was added slowly, and after 1 h the reaction was allowed to come to room temperature slowly and was stirred overnight. The solvents were removed in vacuo and the crude brown solid was used directly in the next step without further purification.
4.1.4. Ethyl 2-(4-azidophenyl)oxazole-4-carboxylate (19). 4Aminobenzamide 18 ( $10.0 \mathrm{~g}, 73.4 \mathrm{mmol}$ ) was suspended in THF $(600 \mathrm{~mL})$ and cooled to $0{ }^{\circ} \mathrm{C}$ then concd $\mathrm{HCl}(35 \mathrm{~mL})$ was added dropwise followed by $t$-BuONO ( $22.0 \mathrm{~mL}, 186 \mathrm{mmol}$ ). The reaction was stirred for 2 h then $\mathrm{NaN}_{3}(14.2 \mathrm{~g}, 218 \mathrm{mmol}$ ) was added in one portion. $\mathrm{H}_{2} \mathrm{O}(150 \mathrm{~mL})$ was then added very carefully and after $1 / 2 \mathrm{~h}$ the reaction was warmed to room temperature. After $21 / 2 \mathrm{~h}$ a saturated solution of $\mathrm{NaHCO}_{3}(80 \mathrm{~mL})$ was added cautiously and the reaction was neutralised by the careful addition of solid $\mathrm{NaHCO}_{3}$. The THF was removed in vacuo and the product was extracted with EtOAc ( $5 \times 200 \mathrm{~mL}$ ), which was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated. The pale yellow solid was used directly in the next step without further purification.

The crude azide was suspended in anhydrous THF ( 300 mL ), under an Ar atmosphere and $\mathrm{NaHCO}_{3}(21.8 \mathrm{~g}, 260 \mathrm{mmol})$ then ethyl bromopyruvate ( $9.40 \mathrm{~mL}, 74.7 \mathrm{mmol}$ ) were added. The reaction was heated to reflux overnight and a second charge of ethyl bromopyruvate ( $9.40 \mathrm{~mL}, 74.7 \mathrm{mmol}$ ) was added in the morning. After a further 6 h reflux the reaction was cooled and filtered through Celite, washing with EtOAc. The filtrate was concentrated then redissolved in anhydrous THF ( 250 mL ) under $\mathrm{N}_{2}$ atmosphere. The mixture was cooled to $0^{\circ} \mathrm{C}$ and trifluoroacetic anhydride ( 31.2 mL , 223 mmol ) was added slowly. The reaction was allowed to warm to room temperature and stirred overnight before the slow addition of a saturated solution of $\mathrm{NaHCO}_{3}(150 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The reaction was neutralised by the careful addition of solid $\mathrm{NaHCO}_{3}$ and the THF was evaporated in vacuo. The crude oxazole was extracted with EtOAc ( $3 \times 250 \mathrm{~mL}$ ), which was washed with brine ( 150 mL ), dried ( $\mathrm{MgSO}_{4}$ ), filtered and concentrated. The oxazole was recrystallised from EtOAc/petrol to give $\mathbf{1 9}$ as light orange needles ( 9.90 g , $38.4 \mathrm{mmol})$. The mother liquors were purified by flash chromatography (9:1, petrol/EtOAc) to give the title compound 19 as a pale yellow solid ( $2.30 \mathrm{~g}, 8.91 \mathrm{mmol}$, total $47.3 \mathrm{mmol}, 64 \%$ over three steps). $R_{f} 0.16$ (9:1, petrol ethers/EtOAc); $\nu_{\text {max }} / \mathrm{cm}^{-1} 3012,2130$, 2097, 1734, 1610, 1598; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.28(1 \mathrm{H}, \mathrm{s}), 8.12(2 \mathrm{H}, \mathrm{d}$, $J 8.6$ ), $7.14(2 \mathrm{H}, \mathrm{d}, J 8.6), 4.45(2 \mathrm{H}, \mathrm{q}, J 7.1), 1.43(3 \mathrm{H}, \mathrm{t}, J 7.1) ; \delta_{\mathrm{C}}$ ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 161.8, 161.3, 143.6, 143.0, 134.8, 128.6, 123.1, 119.4, 61.4, 14.4; HRMS ESI ${ }^{+}$calculated for $\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{NaO}_{3}$ [MNa] ${ }^{+}$ 281.0651, found 281.0651.
4.1.5. 2-(4-Azidophenyl)oxazole-4-carbonyl chloride (20). The azide 19 ( $9.87 \mathrm{~g}, 38.3 \mathrm{mmol}$ ) was dissolved in $\mathrm{THF} / \mathrm{H}_{2} \mathrm{O}(4.3: 1,160 \mathrm{~mL})$ and cooled to $0^{\circ} \mathrm{C}$. $\mathrm{LiOH}(1.39 \mathrm{~g}, 57.9 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$ was added slowly then the reaction was stirred $1 / 2 \mathrm{~h}$ before being warmed to room temperature. After a further $11 / 2 \mathrm{~h} \mathrm{H}_{2} \mathrm{O}$ was added until all the solids had dissolved then the pH was adjusted to $\sim 2$ with $10 \% \mathrm{HCl}$. The mixture was extracted with EtOAc repeatedly ( 150 mL portions) until all the solids had dissolved. The organics were combined, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated. The crude material was used directly in the next step.

The crude acid was suspended in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ THF ( $7: 1$, 175 mL ) under an Ar atmosphere with anhydrous DMF ( 0.2 mL ) and cooled to $0^{\circ} \mathrm{C}$. $(\mathrm{COCl})_{2}(6.50 \mathrm{~mL}, 77.3 \mathrm{mmol})$ was added slowly, and after 1 h the reaction was allowed to come to room temperature and was stirred overnight. The solvents were removed in vacuo and the crude brown solid was used directly in the next step without further purification.

### 4.2. General procedure for the synthesis of amines: $12-17$; 21-26

The crude acid chloride ( $\mathbf{1 1 / 2 0}$ ) ( 0.35 M solution in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}+$ half the volume $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ wash) was added to the desired primary amine (2 equiv, 0.7 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) under an Ar atmosphere at $0{ }^{\circ} \mathrm{C}$. After $1 / 2 \mathrm{~h}$ the reaction was warmed to room temperature and stirred overnight. A saturated solution of $\mathrm{NaHCO}_{3}$ ( $1 / 2$ the volume of reaction) was added and the mixture was stirred vigorously for 10 min . The layers were then separated and the aqueous layer was extracted with EtOAc ( $3 \times 1 / 2$ the volume of reaction). The organics were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated, and the product was purified by flash chromatography $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ to afford the product.
4.2.1. N-(2-(Dimethylamino)ethyl)-2-(4-ethynylphenyl)oxazole-4carboxamide (12). Off-white solid ( $1.46 \mathrm{mmol}, 84 \%$ over three steps). $R_{f} 0.22$ (9:1, $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}\right) ; \nu_{\max } / \mathrm{cm}^{-1} 3413,3301,3010,2826,2109$, $1927,1661,1599 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.23$ ( $1 \mathrm{H}, \mathrm{s}$ ), 7.97 ( $2 \mathrm{H}, \mathrm{d}, \mathrm{J} 8.6$ ), $7.55(2 \mathrm{H}, \mathrm{d}, J 8.6), 7.40(1 \mathrm{H}, \mathrm{br}$ s), 3.57 ( 2 H , app q, J 5.9 ), $3.25(1 \mathrm{H}, \mathrm{s})$, $2.51(2 \mathrm{H}, \mathrm{t}, J 6.1), 2.57(6 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 160.6,160.5,141.0$, 137.7,132.5, 126.7,126.5,124.7, 82.9, 79.8,58.0, 45.4, 36.7; HRMS ESI $^{+}$ calculated for $\mathrm{C}_{16} \mathrm{H}_{18} \mathrm{~N}_{3} \mathrm{O}_{2} 284.1399[\mathrm{MH}]^{+}$, found 284.1407.

### 4.3. General procedure for click reactions

The alkyne ( 1 equiv) and azide ( 1 equiv) were dissolved in $t$ $\mathrm{BuOH}(0.3 \mathrm{M})$ then $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mol} \%)$ was added followed by
sodium ascorbate ( 0.25 equiv) dissolved in $\mathrm{H}_{2} \mathrm{O}$ (equal volume to $t$ BuOH ). The reaction was heated to $100^{\circ} \mathrm{C}$ in the microwave for 25 min then it was cooled to room temperature and diluted with $\mathrm{H}_{2} \mathrm{O}$ (4 volumes). The suspension was filtered and washed with a small amount of methanol then EtOAc. The residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}(9: 1)$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated. A sample was purified by prep HPLC for analysis and biological evaluation (see SD for details).
4.3.1. 1,4-Bis-\{N-(2-(dimethylamino)ethyl)-2-(4-phenyl)oxazole-4-carboxamide\}-1,2,3-triazole (27).
